1. Question 1 Suppose you learn a word embedding for a vocabulary of 10000 words. Then the embedding vectors should be 10000 dimensional, so as to capture the full range of variation and meaning in those words.
1 / 1 point
True
$\odot$
False
Correct  The dimension of word vectors is usually smaller than the size of the vocabulary. Most common sizes for word vectors range between 50 and 400.
2. Question 2 What is t-SNE?
1 / 1 point  ⊙
A non-linear dimensionality reduction technique
C A linear transformation that allows us to solve analogies on word vectors
C A supervised learning algorithm for learning word embeddings

An open-source sequence modeling library

#### Correct

Yes

3.

Question 3

Suppose you download a pre-trained word embedding which has been trained on a huge corpus of text. You then use this word embedding to train an RNN for a language task of recognizing if someone is happy from a short snippet of text, using a small training set.

x (input text)	y (happy?)
I'm feeling wonderful today!	1
I'm bummed my cat is ill.	0
Really enjoying this!	1

Then even if the word "ecstatic" does not appear in your small training set, your RNN might reasonably be expected to recognize "I'm ecstatic" as deserving a label y = 1y=1.

**①** 

True

 $\bigcirc$ 

False

#### Correct

Yes, word vectors empower your model with an incredible ability to generalize. The vector for "ecstatic" would contain a positive/happy connotation which will probably make your model classify the sentence as a "1".

4.

Question 4

Which of these equations do you think should hold for a good word embedding? (Check all that apply)

## 1 / 1 point

 $e_{\{boy\}} - e_{\{girl\}} \wedge e_{\{sister\}} - e_{\{brother\}} e_{boy} - e_{girl} \approx e_{sister} - e_{brother}$ 

V

e {boy} - e {girl} \approx e {brother} - e {sister}eboy−egirl≈ebrother−esister

#### **Correct**

Yes!

V

e {boy} - e {brother} \approx e {girl} - e {sister} eboy−ebrother≈egirl−esister

#### **Correct**

Yes!

e {boy} - e {brother} \approx e {sister} - e {girl} eboy−ebrother≈esister−egirl

5.

Question 5

Let EE be an embedding matrix, and let o\_{1234}o1234 be a one-hot vector corresponding to word 1234. Then to get the embedding of word 1234, why don't we call  $E * o_{1234}E*o$ 1234 in Python?

## 1 / 1 point

 $\mathbf{C}$ 

The correct formula is  $E^T^* o \{1234\}ET^*o_{1234}$ .

O

None of the above: calling the Python snippet as described above is fine.

O

This doesn't handle unknown words (<UNK>).

 $\odot$ 

It is computationally wasteful.

#### **Correct**

Yes, the element-wise multiplication will be extremely inefficient.

6.

Question 6

When learning word embeddings, we create an artificial task of estimating  $P(\text{target} \setminus \text{mid} \text{context})P(\text{target}|\text{context})$ . It is okay if we do poorly on this artificial prediction task; the more important by-product of this task is that we learn a useful set of word embeddings.

## 1 / 1 point

O	
False	

True

#### **Correct**

7.

**Question 7** 

In the word2vec algorithm, you estimate  $P(t \setminus dc)P(t|c)$ , where tt is the target word and cc is a context word. How are tt and cc chosen from the training set? Pick the best answer.

### 1 / 1 point

O

cc is a sequence of several words immediately before tt.

 $\circ$ 

cc is the sequence of all the words in the sentence before tt.

cc is the one word that comes immediately before tt.

◉

cc and tt are chosen to be nearby words.

#### **Correct**

8

Question 8

Suppose you have a 10000 word vocabulary, and are learning 500-dimensional word embeddings. The word2vec model uses the following softmax function:

$$P(t \mid c) = \frac{e^{\left(t \mid c \mid c^T \mid c_c\right)} {\sum_{t'=10000e\theta t' Tece\theta tTec}} (t'=1)^{10000}}$$

$$e^{\left(t \mid c\right)} P(t \mid c) = \sum_{t'=110000e\theta t' Tece\theta tTec}$$

Which of these statements are correct? Check all that apply.

## 1 / 1 point

\theta  $t\theta t$  and e cec are both 10000 dimensional vectors.

#### V

\theta\_t $\theta_t$  and e\_c $e_c$  are both trained with an optimization algorithm such as Adam or gradient descent.

\theta  $t\theta t$  and e cec are both 500 dimensional vectors.

#### **Correct**

After training, we should expect \theta\_t $\theta t$  to be very close to e\_cec when tt and cc are the same word.

9.

Question 9

Suppose you have a 10000 word vocabulary, and are learning 500-dimensional word embeddings. The GloVe model minimizes this objective:

 $\label{limin} $$\min \sum_{i=1}^{10,000} \sum_{j=11,000} f(X_{ij}) (\theta_{i} - \theta_{j} - \theta_{j} - \theta_{j}) (X_{ij}) (\theta_{i} - \theta_{j} - \theta_{j} - \theta_{j}) (\theta_{i} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j}) (\theta_{i} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j}) (\theta_{i} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j}) (\theta_{i} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j}) (\theta_{i} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j} - \theta_{j}) (\theta_{i} - \theta_{j} -$ 

Which of these statements are correct? Check all that apply.

### 1 / 1 point

V

The weighting function f(.)f(.) must satisfy f(0) = 0f(0) = 0.

#### **Correct**

The weighting function helps prevent learning only from extremely common word pairs. It is not necessary that it satisfies this function.

V

X  $\{ij\}X_{ij}$  is the number of times word j appears in the context of word i.

#### **Correct**

\theta  $i\theta_i$  and e  $je_i$  should be initialized to 0 at the beginning of training.

V

\theta  $i\theta_i$  and e  $je_i$  should be initialized randomly at the beginning of training.

#### **Correct**

10.

Question 10

You have trained word embeddings using a text dataset of  $m_1m_1$  words. You are considering using these word embeddings for a language task, for which you have a separate labeled dataset of  $m_2m_2$  words. Keeping in mind that using word embeddings is a form of transfer

learning, under which of these circumstances would you expect the word embeddings to be helpful?

# 1 / 1 point

 $\circ$ 

m\_1*m*1 << m\_2*m*2

 $\odot$ 

 $m_1m_1 >> m_2m_2$ 

## Correct
